

# Kubernetes made simpler

with K8s Operators

# Agenda

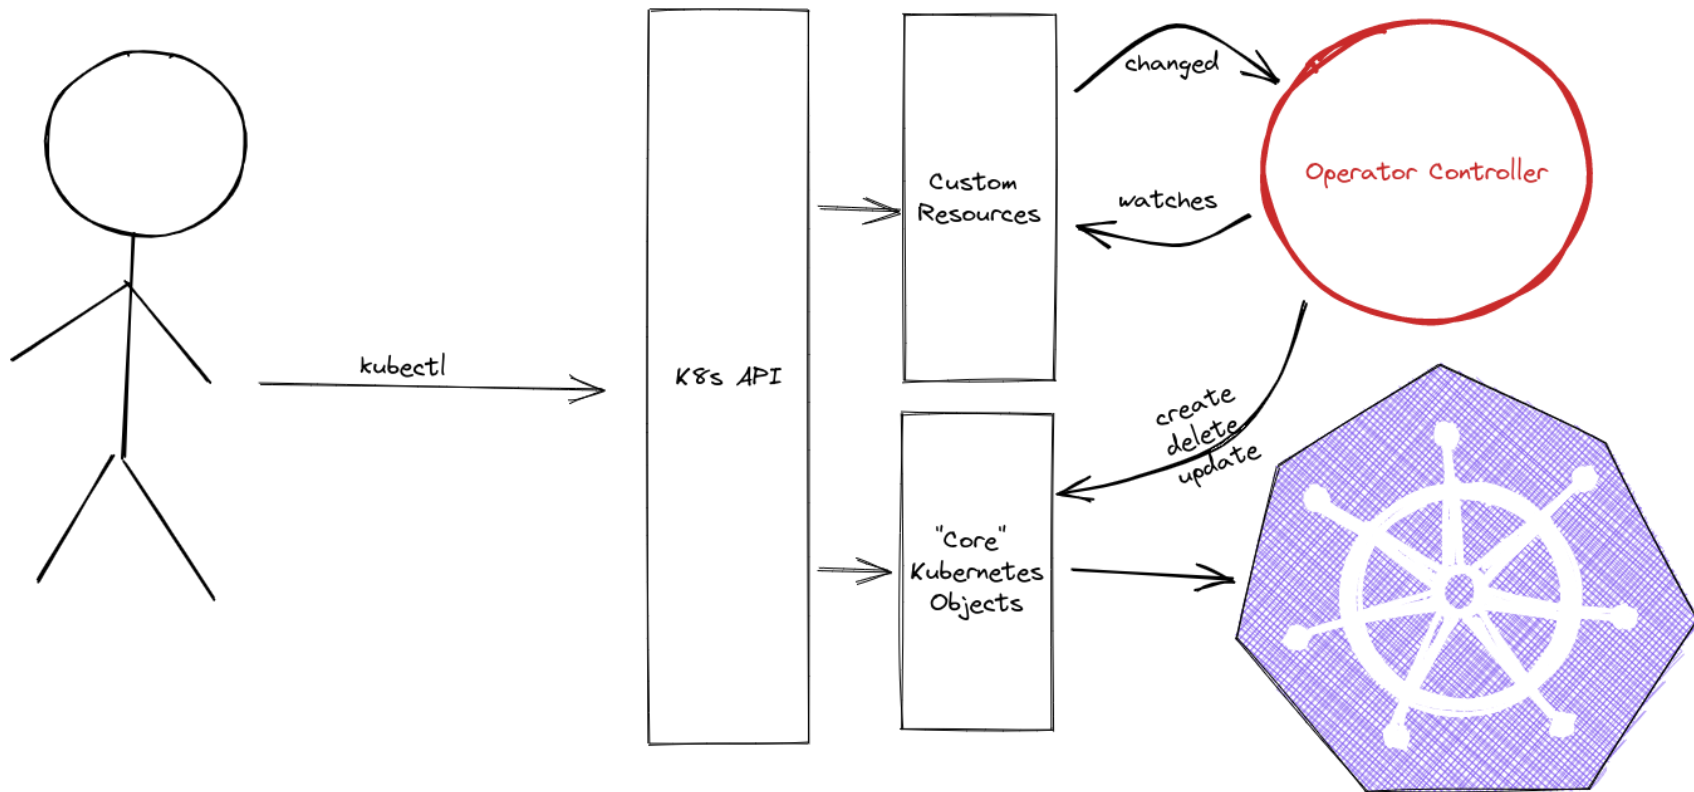

---

1. Operator – What is that?
  - Custom Ressource Definition
  - Controllers
2. Working with existing operators
  - Finding
  - Deploying
  - Using
3. Developing your own operator
  - Operator SDK using helm
  - Java using fabric8
4. Recap

---

# What's a K8s operator

About K8s extendability, CRDs and Aggregation Layers

```
apiVersion
kind
metadata
spec:
  group
  versions:
    - name
      schema:
        openAPIV3Schema:
          type
          properties:
            spec:
              type:
                properties:
                  myProperty
```

YAML

```
apiVersion
kind
metadata
spec:
  myProperty
```

YAML

Red arrow: `kubectl get myResource -o json`

register CustomResource

kube-apiserver

```
{
  "apiVersion",
  "items" : [
    {
      "apiVersion",
      "kind",
      "metadata",
      "spec"
    }
  ]
}
```

JSON

# How does this help us?

---

## Use existing operator

Manage cloud resources from within your K8s cluster

## Write your own

Bundle your deployments / Toolings in one operator

---

# Working with operators

Finding, deploying and using operators

---

# Developing your operator

Operator SDK and Helm or fabric8 and Java

---

# Recap

When should you use a operator AND when shouldn't you

# Recap

---

## When / Why to use

- Ease of use
  - Using existing Operators
  - Deploying operators as K8s Deployments
- Simplifying Cloud
  - Common understanding of Cloud resources
  - Bundle Cloud Resources and Application
- K8s Native Applications
  - Interact with your Platform
  - Integrate in K8s to use full potential

## When / Why not to use

- Maintenance
  - Who is responsible for operator
- Development
  - Treat your operator as a feature, which costs development time
  - Less focus on Business Logic
- Trust the Operator
  - RBAC setup and vast permissions for Operator to work needed
  - What does the operator do behind the scene -> Strip down "magic"
